Six blocks do most of the work

when flag clicked
Hat — starts the script. One per job.

forever / repeat
Loop — does it again, or a set number of times.

if / else
Selection — two roads, both planned.

set / change
Variable — one name, one value, one display.

broadcast / receive
Message — one script tells another to start.

define / call
Custom block — name it, then use the name.

The rule that saves the lesson

If you use it twice, name it.

Duplication is not a shortcut. It is four places to fix the same bug.
